INFINITY WEB & APPS

Client Demo Call Script

Infinity Studios platform: a word-for-word guide for presenting the working demo and the production plan on Zoom or Google Meet.

40–45 min	25 min	10 min	10 min
full call	live demo	plan & timeline	questions

How to use this script

- **SAY** boxes are what you speak. Read them naturally and use your own words.
- **DO / CLICK** boxes are the exact actions on screen.
- **Yellow tips** are for you only: things to watch out for.
- Share your **whole screen** (not one tab) so the client sees the Razorpay payment window too.

Before the call

15 minutes before

> **Most important:** the free demo hosting falls asleep after 15 minutes without visitors, and the first visit takes about a minute to wake it. Open the API link first, then every site, 10–15 minutes before the call and keep the tabs open.

- ☐ Open `https://infinity-demo-api.onrender.com/api/health` and wait until it shows `ok`
- ☐ Open the tabs in this order (if your Render service names differ, use your own URLs):
  - ☐ Studio site: `https://infinity-demo-studio.onrender.com`
  - ☐ Admin: `https://infinity-demo-admin.onrender.com`
  - ☐ Photography: `https://infinity-demo-photo.onrender.com`
  - ☐ Podcast: `https://infinity-demo-podcast.onrender.com`
  - ☐ Events: `https://infinity-demo-events.onrender.com`
- ☐ Sign in to the **admin** tab: `admin@demo.example` / `DemoAdmin!2026`
- ☐ In admin, open **Integrations** and click **Verify now** on Razorpay so it shows **Connected and verified**. (For the clearest labels, merge the latest code from GitHub and redeploy first.)
- ☐ Have the customer login ready: `customer@demo.example` / `DemoCustomer!2026`
- ☐ Have the Razorpay test details ready: **Netbanking** (any bank, then click **Success**), or card `5267 3181 8797 5449` with any future expiry and any CVV
- ☐ Have a small PDF or image on your desktop to attach to a quote request
- ☐ Have the delivery plan PDF open in another window
- ☐ Do one quick test booking yourself to confirm everything is awake
- ☐ Close email and chat notifications before sharing your screen

1 · Opening

2 min

SAY

"Hi [name], thanks for making the time. Today I'd like to do three things: show you the working platform live, show you what we'll do to take it to a full launch with real payments and your own domain, including the mobile app, and answer any questions you have.

Everything I'm showing you is running live on the internet right now, not slides. The names, prices and photos are placeholders. You'll give us the real ones, and they're all editable from the admin panel."

2 · The big picture

2 min

SAY

"Here's how it fits together. There's one platform underneath, with one database, one booking engine and one payment system. On top of it we have:

- a **main booking site**, Infinity Studios, where customers discover and book photography, video and podcast studio services, similar to how BookMyShow works for movies;
- three **brand websites** for photography, podcasting and events;
- one **admin panel** where your team manages everything.

Because it's one system, a booking made anywhere shows up in the same admin panel, and a time slot can never be double-booked. The mobile app will plug into the same system."

3 · Live demo: the customer's journey

12 min

3.1 Home page

DO / CLICK

1. Switch to the **Infinity Studios** tab and scroll slowly down the home page.

SAY

"This is what your customer sees first. At the top there's the logo, a city selector, a search bar and a 'Book now' button. Below that is the category bar: photography, videography, podcast studio, video production, studio rental and more.

The banners at the top are managed from the admin panel, so you can change offers and campaigns yourself. These 'Popular services' are ranked by real bookings. The green 'Next free' time on each card is the actual next open slot from the live calendar, not a made-up label."

3.2 Search and city

DO / CLICK

1. Click the **city selector** at the top and choose **Bengaluru**.
2. Type **podcast** in the search bar and pause on the suggestions.
3. Click **Video podcast recording**.

SAY

"Customers can pick their city, and the site only shows what's available there. Search suggests matching services as you type, and it also matches packages and equipment."

3.3 Service page and booking panel

DO / CLICK

1. Scroll through the photos, then click one to open the full-screen gallery. Close it.
2. Point out the packages, add-ons, equipment, location and hours, and cancellation policy.
3. In the **booking panel** on the right, pick a duration or package, tick an add-on, and watch the price update.
4. Choose a date in the calendar, then a start time.

SAY

"This is the service page. Everything a customer needs to decide is here: photos, packages, add-ons, equipment, location, opening hours and the cancellation policy.

On the right is the booking panel. As I change the package or add an extra, the price updates instantly, including tax and the deposit. The price is always calculated on our server, so it can't be tampered with. The calendar only shows times that are genuinely free for this room."

Tip: on a phone-sized screen the panel becomes a bar at the bottom. If the client asks about mobile, narrow your browser window to show it.

3.4 Book and pay (Razorpay test mode)

DO / CLICK

1. Click **Continue to book**. Enter a name and an email you can show, click **Review booking**, tick the terms, then click **Reserve and continue to payment**.
2. On the booking page, point at the **"Razorpay test mode"** notice, then click **Pay deposit**.
3. In the Razorpay window, choose **Netbanking**, then any bank, then click **Success** on the test bank page. Or use the test card.
4. Wait for the status to change to **Confirmed**, then click **View receipt**.

SAY

"When the customer reserves, the slot is held for them while they pay, so nobody else can grab it. The booking is only confirmed once the payment is verified.

This is the real Razorpay checkout, the same one customers will use, running in Razorpay's test mode, so no real money moves. After payment our server double-checks with Razorpay before confirming. Even if the customer closes the window mid-payment, the system checks with Razorpay and still records it.

And here's the receipt, which they can print or save as a PDF."

If the Razorpay window doesn't open: refresh the page and click **Pay deposit** again. If the booking page still says "Demo payment mode", the demo is using simulated payments instead; just click **Simulate successful payment** and explain that the real checkout is switched on with keys.

3.5 Custom quote with attachment

DO / CLICK

1. Open **Commercial Production** (or search "brand") and click **Brand & advertising shoots**.
2. Click **Request a quote**. Fill in the project type, date and people, attach your sample file, add contact details, then click **Send brief**.

SAY

"Bigger projects like brand campaigns don't have a fixed price. Instead, the customer sends a brief with references and files. This is never a booking. The team reviews it and sends back an itemised quotation, which the customer can accept online. I'll show you the admin side of this in a minute."

3.6 Customer account

DO / CLICK

1. Click **Sign in** (top right) and use the demo customer login.
2. Show the upcoming and past bookings, saved services, and notification preferences.
3. Optional: open a booking that is more than 48 hours away and click **Request a new time**.

SAY

"Customers have their own account where they see upcoming and past bookings, save favourite services, choose email or WhatsApp reminders, and ask to reschedule. A reschedule doesn't move the booking straight away. The team approves it first, and the original slot stays reserved until then."

4 · Live demo: the admin panel

10 min

SAY

"Now let me switch to what your team sees."

4.1 Dashboard

DO / CLICK

1. Switch to the **Admin** tab and click **Dashboard**.

SAY

"The dashboard shows everything that needs attention: bookings to review, open enquiries, reschedule requests, popular services, how full each room is today, and upcoming sessions. All of these numbers come live from the database. Test and simulated payments are shown separately and are never counted as revenue."

4.2 The booking we just made

DO / CLICK

1. Click **Bookings** and open the booking you just made (the newest row).

SAY

"Here's the booking we just made, with the payment, the full price breakdown and a history of every change. Staff can reschedule, cancel, add notes or issue a refund from here."

4.3 Enquiries and quotations

DO / CLICK

1. Click **Enquiries & briefs** and open the brief you just sent.
2. Click the attachment to show the download, then point at the **Prepare quotation** form.

SAY

"Here's the brief, with the file the customer attached. The team builds a quotation line by line, and the system adds tax and the deposit. Once the customer accepts, staff convert it into a confirmed booking with one click, and the system checks the room is still free first."

4.4 Reschedule requests

DO / CLICK

1. Click **Reschedule requests**. If there's one pending, click **Approve**.

SAY

"Reschedule requests come here. When you approve, the system re-checks that the new time is free, moves the booking and notifies the customer."

4.5 Managing the website content

DO / CLICK

1. Click **Studio site** and show the tabs: **Home banners**, **Browse categories**, **Equipment & facilities**, **Testimonials**, **Policy pages**.
2. Click **Services & packages** and open any service to show prices, packages, featured flag and deposit %.

SAY

"Your team controls the website without a developer: the banners, categories, equipment, policies, services, packages, prices, and even the deposit percentage per service.

Two things I want to point out. First, testimonials can only be published once you confirm the client gave permission, so the site only ever shows genuine reviews. Second, the equipment is marked 'awaiting verification' until you confirm the exact models. We don't put anything on the site that isn't true."

4.6 Payments and integrations

DO / CLICK

1. Click **Payments** and show the test payment.
2. Click **Integrations**: Razorpay shows as verified (you clicked Verify now before the call), with test-mode keys.
3. Optional: click **Notifications** → **Templates** to show that message wording is editable.

SAY

"All payments and refunds are listed here, with test payments clearly labelled. The Integrations page shows the honest state of each connection. Razorpay is connected in test mode. Email, SMS and WhatsApp are built in, and messages are prepared and logged, but they start sending once you choose providers. You can also edit the wording of every customer message."

4.7 The brand websites (optional, 1 min)

DO / CLICK

1. Quickly show the **Photography**, **Podcast** and **Events** tabs.

SAY

"These are the individual brand websites. Each has its own look but runs on the same engine, so bookings from all of them land in the same admin panel. The events site works mostly through enquiries and quotations, because events are always custom."

5 · Being clear about what's demo

1 min

SAY

"To be completely transparent about what you've seen:

- **Placeholders:** the brand names, services, prices, addresses, photos and policy text. They're labelled as such and will be replaced with yours.
- **Test mode:** payments run through real Razorpay, but in test mode. Live payments need your Razorpay account to be activated.
- **Not sending yet:** emails and messages are prepared but don't go out until we connect a provider.
- **Demo hosting:** the current free hosting sleeps when idle. That's why we move to AWS for launch."

6 · The plan to go live

8–10 min

DO / CLICK

1. Share the **delivery plan PDF**. Start on page 2 (Summary), then go to the timeline chart.

SAY

"Now, how we take this to a full launch. We plan around a small dedicated team of three to four people.

- **Week 12:** websites and admin live on your domain, on AWS.
- **Week 16:** the Android and iOS apps live, subject to Google and Apple's review.
- **Then four weeks** of close support after launch.

The overall range is fourteen to eighteen weeks. What mostly decides where we land is how quickly we get content and approvals, more than development."

Walk through the phases (timeline page)

SAY

1. **Weeks 1–2:** we finalise scope and collect your content, prices and policies, and set up accounts: AWS, domain, Razorpay, Apple and Google developer accounts.
2. **Weeks 2–4:** we build the AWS setup, with separate staging and live environments, automatic backups and monitoring. You get a private staging link to review.
3. **Weeks 3–9:** your real content goes in. Files move to secure storage, and we add proper GST invoices and SEO.
4. **Weeks 4–10:** live Razorpay payments, emails from your own domain, and SMS and WhatsApp if you want them.
5. **Weeks 5–14:** the mobile app, built in React Native: one app for both Android and iOS, using exactly the same system as the website, so prices and availability always match.
6. **Weeks 10–15:** testing, a security check, load testing, and your own acceptance testing before anything goes live."

Hosting and running costs (costs page)

SAY

"Everything will be hosted on AWS in Mumbai, so the data stays in India. The database is backed up daily, and card details never touch our servers; Razorpay handles them.

For running costs, AWS hosting at launch is estimated at roughly fifteen to thirty-three thousand rupees a month, depending on traffic and options. On top of that there are:

- Razorpay's per-transaction fee;
- the domain;
- the Apple developer account at 99 dollars a year, and Google Play at 25 dollars one-time.

These are estimates, and we'll confirm exact figures when we set up AWS. You pay these directly, so you own every account and all your data."

Don't quote a development price from this script. Present your fee separately, as you planned.

What we need from them (client inputs page)

SAY

"To hit these dates, we'll need a few things from your side early:

- **Week 1–2:** final brand and content, prices and GST details, and your cancellation and refund policy.
- **Week 2:** Razorpay account documents submitted, because activation can take from a few days to a few weeks.
- **Week 4:** Apple and Google developer accounts. Apple needs a company D-U-N-S number, which can take a week or two."

7 · Close and next steps

2 min

SAY

"So, to sum up: the core platform is built and working, as you've seen. We'd go live on the web in about twelve weeks and in the app stores in about sixteen.

The next steps are:

1. You review the plan, and we confirm the scope together.
2. We agree a start date.
3. We start the account setup, especially Razorpay and the Apple developer account, since those take the longest.

I'll send you the plan PDF and the demo links after this call, so you can try it yourself. What questions do you have?"

After the call, send: the delivery plan PDF, the studio site and admin links, the demo logins, and the Razorpay test payment instructions. Remind them that the first page load can take up to a minute.

8 · Likely questions and suggested answers

Can two customers book the same slot at the same time?

No. The system locks the time slot when someone reserves, re-checks on the server, and the database itself rejects overlaps. We tested this with eight simultaneous requests for one slot; only one succeeded.

Is the payment real? Is it safe?

It's the real Razorpay checkout in test mode today. For launch we switch to your live Razorpay keys. Card details are handled entirely by Razorpay and never touch our servers, and every payment is verified with Razorpay before a booking is confirmed.

Can we change prices, services and photos ourselves?

Yes. Services, packages, prices, deposits, banners, categories, equipment, FAQs, policies and message wording are all managed in the admin panel, with no developer needed.

Will customers get emails, SMS or WhatsApp messages?

Yes, once we connect providers in the launch phase. The messages and templates are already built. SMS in India needs DLT registration, so we start that early; email works first.

What about refunds and cancellations?

Staff can issue full or partial refunds from the admin panel, and they go back through Razorpay. The cancellation rules will follow the policy you give us.

Can the website handle a lot of traffic?

On AWS it scales by adding more servers, and we load-test it for your expected peak before launch. The free demo hosting is just for showing it.

Why does the demo sometimes load slowly at first?

The free demo hosting sleeps when nobody is using it, and the first visit wakes it up. The AWS production setup doesn't sleep.

Who owns the code and the data?

You do. The AWS, Razorpay, domain and app store accounts are in your name, and your data stays in AWS Mumbai. (Confirm code ownership terms in your contract.)

Will the app look and work like the website?

Yes. It follows the same discovery-and-booking style and uses the same system, so availability, prices and bookings are identical. It adds push notifications for confirmations and reminders.

Can it be faster than 12–16 weeks?

A larger team can shorten it to roughly 10–12 weeks, at a higher cost. In practice the bigger factor is how quickly content and approvals (Razorpay, Apple) come through.

Can we add features later, like memberships or offers?

Yes. The platform is built to extend. New features are scoped and estimated separately so they don't delay the launch.

What happens after launch?

We provide four weeks of close support (hypercare) for monitoring, fixes and tuning. Ongoing maintenance can be agreed separately.

Is our customers' data secure?

Accounts have role-based permissions, every admin action is recorded in an audit log, data is encrypted in storage and in transit, and we run a security review and penetration test before launch.

If something goes wrong during the demo

Problem	What to do and say
A page shows an error or loads slowly	Wait 30–60 seconds and refresh. "This is the free demo hosting waking up. The live AWS version doesn't sleep."
Razorpay window doesn't open	Refresh, then click Pay deposit again. Or continue in the admin panel and show a previous test payment.
No time slots on a date	Pick a later date. Some sample studios are closed on certain days.
"Too many requests" message	The demo blocks too many bookings in a short time as spam protection. Show an existing booking in admin instead.
Studio home page looks empty	Refresh once the API is awake. Open the API health link in another tab first.
